

Grade 5 Science Textbook Notes

Chapter 1: Plants and Photosynthesis

Photosynthesis:

Plants make their own food using sunlight, water, and carbon dioxide.

The green pigment chlorophyll helps plants capture sunlight.

Process:

1. Roots absorb water from soil.
2. Leaves take carbon dioxide from air.
3. Sunlight provides energy.
4. Plant produces food and releases oxygen.

Important Points:

- Plants are called producers because they make their own food.
- Leaves are the main place where photosynthesis happens.
- Oxygen released by plants helps living things breathe.

Chapter 2: Human Body

The human body has different systems that work together.

Digestive System:

It breaks food into nutrients that the body can use.

Respiratory System:

It helps us breathe and exchange oxygen and carbon dioxide.

Circulatory System:

The heart pumps blood throughout the body.

Chapter 3: Solar System

The solar system contains the Sun and objects that move around it.

Planets:

- Mercury
- Venus
- Earth
- Mars
- Jupiter
- Saturn
- Uranus
- Neptune

Earth is the only known planet with life because it has suitable conditions.

Chapter 4: Water Cycle

The water cycle describes how water moves around Earth.

Stages:

- Evaporation: Water changes into vapor.
- Condensation: Vapor forms clouds.
- Precipitation: Water falls as rain or snow.

Chapter 5: Forces and Motion

A force is a push or pull that can change the motion of an object.

Examples:

- Gravity pulls objects toward Earth.
- Friction slows moving objects.
